## ANTIBIOTIC USE

Prosciutto, pepperoni, bacon, meatballs, ham, and sausage - the menu for meat pizzas is huge, and positively mouth-watering, unless you're vegetarian or vegan, in which case, we apologise, but this section may still be of interest to you...

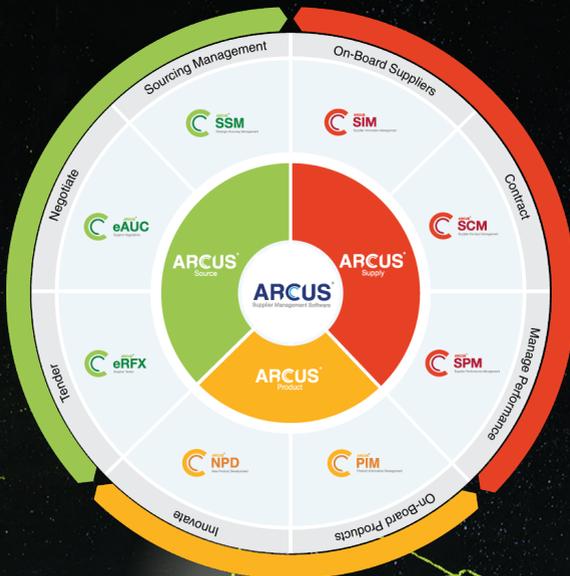

Antimicrobial Resistance (AMR) is no longer a threat to humans, it has become reality, and according to Dame Sally Davies, England's chief medical officer, antimicrobial resistance has the potential to cause 80,000 deaths over the next 20 years, causing "an apocalyptic scenario".

Scary stuff, but what does this have to do with your humble slice of pizza?

The fact is that routine use of antibiotics on livestock such as pigs and cows is having a knock on effect on our health further down the food chain, as our bodies are developing to become resistant to antimicrobial drugs.

As an increasing number of people demand to know more about the origins of their food, both through lifestyle choices and from a health perspective, food and drink businesses, including pizza companies, are seeking ways in which they can identify and eradicate the risk of antibiotics entering their meat supply chain when it comes to creating toppings for pizzas.

## A SLICE OF INDUSTRY EXPERIENCE...

ARCUS® SIM can be used by food and drink companies to manage and track the use of antibiotics in the supplychain, and to identify suppliers which comply with its requirements. Monitoring antibiotic usage information from suppliers can be a difficult task when carried out manually, especially if the supply chain is large and international, where different ethics, rules and regulations apply.

ARCUS® SIM removes the hassle when it comes to gathering policies and data from suppliers, as it places the responsibility onto the supplier to upload and provide quality and technical professionals with the required information.

Comprehensive online questionnaires are configured to individual needs and gather only the most relevant data to help identify antibiotic-free meat suppliers. Storing all of this information centrally in the cloud enables key stakeholders to access it at any time, and creates an easy way of recalling information should its antibiotic use status be questioned.

So rest assured that your meaty pizza is antibiotic-free and delicious.

Supplier Management Software

ARCUS<sup>®</sup> SIM brings together business departments by providing a seamless approach to managing different levels of supplier risk.

Procurement, technical, and supply chain teams can manage their individual supply chain risks through one central system, removing silos of information, and providing complete transparency over the status of each supplier.

Food and drink companies now have specialist functionality in SIM, made up of pioneering industry specific plug-ins which revolutionise how users manage the associated risks. The plug-ins can be deployed to evaluate and approve deeper levels of information at a manufacturing site level, as well as site audit capabilities.

Now, more than ever before, departments can share one true vision over their supplier's products.
